## Introduction

Configuration, usage and maintenance of the Spectralink 8400 series wireless telephone involves many tasks. Among these tasks are creating and building configuration files to load over the USB cable (initial provisioning), and other configuration files to load over the WLAN when powered up (central provisioning). Once the 8400 wireless telephones are operational on the WLAN and in use, maintaining the wireless telephones, configuration files and investigation of reported issues are involved.

Reported issues and subsequent investigations often lead to the WLAN to discover how well it supports the wireless telephone, or to areas which do not properly support the wireless telephone.

Log file analysis is of particular interest to the 8400 telecommunications maintenance technician and network support engineer. Often, log data and syslog data from the 8400 telephone is the only operating data from the perspective of the wireless telephone itself.

Log files include mac-app.log, mac-now-app.log, mac-boot.log, mac-now-boot.log and syslog files. All log files, along with configuration files for a particular phone, can be invaluable for feedback and discovery of the 8400 wireless telephone power-up sequence, historical status, error messages and operation. Mac-now-app.log and mac-now-boot.log files are created, and saved to the provisioning server when the 8400 keys 1, 5 & 9 are pressed simultaneously and held for about three seconds (until the phone beeps).

The intent of this manual is to document:

- The module logging categories
  - The terms ‘logging modules’ and ‘logging categories’ are synonymous
  - Module is the official term while category may describe it better
  - Each module is a software sub-system component
- What each module does or applies to
- What each log level does
- Which level should be used for troubleshooting a particular issue
- How to select the proper module and level when working a problem
- How to select the proper Global Log Level Limit (Render Level)
- Identify the steps to use when troubleshooting a problem, collect data & isolate the issue

There are three ways to check or set certain parameters on the phone. They are:

- Web based access using a browser with the IP address of the 8400 phone
  - Settings > Logging > Global Settings
  - The above means with a browser connection use the Settings menu, then choose Logging, then choose Global Settings
- 8400 Keypad based access
  - Settings > Status > Platform > Phone
  - The above means use the keypad carousel to select Settings, then select Status, then select Platform, then select Phone
- Configuration files

- log.render.level="1" is used in a configuration file loaded to the phone during power-up provisioning. This sets the Global Log Level limit to 1.

## How to Begin Additional Data Collection for Specific Issues

To begin the process of choosing which modules to set for additional logging detail the problem must be described with some detail. Is the problem related to an 8400 bluetooth headset or does poor audio occur when roaming between APs? Is a certain parameter not being set on the 8400 phone or are there no log files being saved to the provisioning server?

Each of these issues and many others can be successfully investigated, identified and resolved using log files from the 8400 phone. Of course, other data may be useful too. The configuration files loaded to the 8400, the provisioning server protocol log, general symptom descriptions from users and other data sources and times of the failure may be useful for troubleshooting a particular issue or failure.

The log file analysis script '8400mac-appmac-bootanalysisv14.exe' may be useful once log files are available.

For the issue of no log files being saved to the provisioning server, a web connection from a PC will enable log files to be downloaded to that PC for analysis, even when the 8400 phone cannot connect to or write log files to its provisioning server. There is a way to collect additional log information. With a web browser connection do the following: Diagnostics Menu → View & Download Logs → Select App log, select Log Level Filter of All, click Export, click Save to save the app.log file on the PC. Then select Boot log, select Log Level Filter of All, click Export, click Save to save the boot.log on the PC. These files, will be limited in size to available memory in the handset, but can be analyzed or sent to 8400 support teams for analysis. When log files are saved to the provisioning server they are prepended with the MAC address of the phone [00907a0e1234-app.log & 00907a0e1234-boot.log].

With a general symptom description, it can be as simple ☺ as scanning through the section called: Logging Module Topics Detail List, to identify the modules to set the log.level for more detail [Event 1 versus Minor Error – 1 versus 4]. Or do a computer search for a variety of search strings to determine which modules and levels are related to a particular issue. It can help to do a visual scan to learn text strings to search for. This can help identify all modules and levels pertaining to a particular issue.

For accuracy and to prevent errors in data collection, it is useful to restrict the number of modules set to 1 for detailed logging to five or six and have all other modules set to default levels (4 or higher). It may be possible to effect logging capability, in a negative way, if too many logging modules are set to detailed [Event 1] level or lower [Debug].

## Logging Parameter Definitions List

Web Module Name	Config file parameter name	Description & Comment
Settings > Logging > Global Settings		Web Browser Location
Global Log Level Limit	log.render.level	The render log level determines the lowest severity log level that can be logged for any sub-system component. Render level of 1 allows any log.level.change component to log as low as level 1. Default is Event 1.
Type	log.render.type	This specifies how the time stamp displays in log messages. Options include several formats that use the following: Y-Year, M-Month, D-Day, M/m-minutes, S-seconds and ms-milliseconds. Default is MDHms.
Log to Standard Output	log.render.stdout	The 8400 phone does not have a console to have its logs printed to standard out. Default is Enabled but can be disabled on 8400 phones unless a special phone is used with console cable attached.
Log to File	log.render.file	When enabled, the phone will write logs to its flash (internal) file system. The phone will upload the logs when a specified time period has elapsed or the phone's memory is full. Disabling will stop the phone from uploading all logs to its provisioning server. Default is Enable.
Log File Size (Kbytes)	log.render.file.size	This determines the maximum size (in KB) of the internal log buffer maintained by the phone. When the maximum size is reached, the log file is written to the provisioning server. Default is 32 KBytes.
Settings > Logging > Log File Upload		Web Browser Location
Upload Period (s)	log.render.file.upload.period	This determines how often log files are written to the provisioning server. Default is 86400 seconds (24 hours)
Append When Uploading	log.render.file.upload.append	This determines if log files are appended when uploaded to the provisioning server. When enabled, log files are appended. When

		disabled, log files are not appended. Default is Enabled.
Upload Append Size Limit (Kbytes)	log.render.file.upload.append.sizeLimit	This determines the maximum size log files on the provisioning server. When the limit is reached, log files are either deleted (while logging continues with a new file) or logging stops. Default is 512KB.
Upload Append Limit Mode	Log.render.file.upload.append.limitMode	This controls how the provisioning server handles log files that have reached their maximum size limit. Select Delete to delete old log files and start over to save new data. Select Stop to stop downloading log file data from the phone when maximum size is reached. Default is Delete.
<b>Settings &gt; Logging &gt; Module Logging Level Limits</b>		<b>Web Browser Location</b>
App Communication	log.level.change.acom="4"	APPlication Communications. Default is Minor Error = 4
Application	log.level.change.app1="4"	Application logging Default is Minor Error = 4
ARES	log.level.change.ares="4"	ARES logging. Default is Minor Error = 4
Background Dialog	log.level.change.bdiag="4"	Background Dialog logging. Default is Minor Error = 4
Barcode	log.level.change.barcd="4"	Barcode logging. Default is Minor Error = 4
Bluetooth	log.level.change.bluet="4"	Bluetooth logging. Default is Minor Error = 4
Bluetooth Driver	log.level.change.drvbt="4"	Bluetooth Driver logging. Default is Minor Error = 4
Browser	log.level.change.brow="4"	Browser logging. Default is Minor Error = 4
Buffer	log.level.changedbuf="4"	Buffer logging. Default is Minor Error = 4
Button Style	log.level.change.style="4"	Button Style logging. Default is Minor Error = 4
Call list	log.level.change.clist="4"	Call List logging. Default is Minor Error = 4
Call Media Playback	log.level.change.cmp="4"	Call Media Playback logging. Default is Minor Error = 4
CDP	log.level.change.cdp="4"	CDP logging. Default is Minor Error = 4
Certificate	log.level.change.cert="4"	Certificate logging. Default is Minor Error = 4
C-Link	log.level.change.clink="4"	C-Link logging.

		Default is Minor Error = 4
Configuration	log.level.change.cfg="1"	Configuration logging. Default is Event 1 = 1
Copy utilities	log.level.change.copy="4"	Copy Utilities logging. Default is Minor Error = 4
CURL	log.level.change.curl="4"	CURL logging. [transfer a URL programming] Default is Minor Error = 4
Daisy Chaining	log.level.change.peer="4"	Daisy Chain logging. Used for daisy chained VVX phones. Default is Minor Error = 4
Database	log.level.change.dbs="4"	Database logging. Default is Minor Error = 4
DHCP Client	log.level.change.dhcpc="4"	DHCP Client logging. Default is Minor Error = 4
DNS	log.level.change.dns="4"	DNS logging. Default is Minor Error = 4
Dot1x	log.level.change.dot1x="4"	Dot1x logging. Default is Minor Error = 4
EFK	log.level.change.efk="4"	EFK [Extended Feature Keys] logging. Default is Minor Error = 4
Ethernet Filter	log.level.change.ethf="4"	Ethernet Filter logging. Default is Minor Error = 4
Exchange Client	log.level.change.ec="4"	Exchange Client logging. Default is Minor Error = 4
Headset	log.level.change.hset="4"	Headset logging. Default is Minor Error = 4
HTTP Auth	log.level.change.httpa="4"	HTTP Authorization logging Default is Minor Error = 4
HTTP Server	log.level.change.httpd="4"	HTTP Server logging. Default is Minor Error = 4
HTTP TA	log.level.change.ht="4"	HTTP TA logging. Default is Minor Error = 4
HW Desc	log.level.change.hw="4"	HTTP Description language logging. Default is Minor Error = 4
HW Signal	log.level.change.sig="4"	HW Signal logging. Default is Minor Error = 4
Idle Browser	log.level.change.ib="4"	Idle Browser logging. Default is Minor Error = 4
Key Observer	log.level.change.key="4"	Key Observer logging. Default is Minor Error = 4
LDAP	log.level.change.ldap="4"	LDAP [Lightweight Directory Access Protocol] logging. Default is Minor Error = 4
License	log.level.change.lic="4"	License logging. Default is Minor Error = 4
Logging	log.level.change.log="4"	Logging logging.

		Default is Minor Error = 4
Media Recorder	log.level.change.cmr="4"	Media recorder logging. Default is Minor Error = 4
Micro Browser	log.level.change.mb="4"	Micro Browser logging. Default is Minor Error = 4
Network	log.level.change.net="1"	Network logging. Default is Event 1 = 1
Niche	log.level.change.niche="4"	Niche logging. Default is Minor Error = 4
OAI Protocol	log.level.change.oaip="4"	OAI [Open Application Interface] logging. Default is Minor Error = 4
OCSP	log.level.change.ocsp="4"	OCSP [Online Certificate Status Protocol] logging. Default is Minor Error = 4
On Screen Display	log.level.change.osd="4"	On Screen Display logging. Default is Minor Error = 4
PDC	log.level.change.pdc="4"	PDC logging. Default is Minor Error = 4
PMT	log.level.change.pmt="4"	PMT logging. Default is Minor Error = 4
Pnet	log.level.change.pnetm="4"	Pnet logging. Default is Minor Error = 4
Poll	log.level.change.poll="4"	Poll logging. Default is Minor Error = 4
Power Saving	log.level.change.pwrsv="1"	Power Save logging. Default is Event 1 = 1
PPS	log.level.change.pps="4"	PPS logging. Default is Minor Error = 4
Presence	log.level.change.pres="4"	Presence logging. Default is Minor Error = 4
Presentation	log.level.change.pgui="4"	Presentation logging. Default is Minor Error = 4
PTT	log.level.change.ptt="4"	PTT [Push To Talk] logging. Default is Minor Error = 4
Push	log.level.change.push="4"	Push logging. Default is Minor Error = 4
RAM Disk	log.level.change.rdisk="4"	RAM Disk logging. Default is Minor Error = 4
Resource Finder	log.level.change.res="4"	Resource Finder logging. Default is Minor Error = 4
RTLS	log.level.change.rtls="4"	Real-Time Locating System logging. Default is Minor Error = 4
RTOS	log.level.change.rtos="4"	Real-Time Operating System logging. Default is Minor Error = 4
Scheduled	log.level.change.slog="4"	Scheduled logging. Default is Minor Error = 4

Security	log.level.change.sec="4"	Security logging. Default is Minor Error = 4
SIP	log.level.change.sip="4"	Session Initiation Protocol Communications logging. Default is Minor Error = 4
Srtp	log.level.change.srtp="4"	Secure real-time transport protocol logging. Default is Minor Error = 4
SSH Client	log.level.change.sshc="4"	SSH [Secure Shell] Client logging. Default is Minor Error = 4
SSPS	log.level.change.ssps="4"	SSPS logging. Default is Minor Error = 4
Support Objects	log.level.change.so="4"	Support Objects logging. Default is Minor Error = 4
Syslog	log.level.change.sys="4"	Syslog logging. Default is Minor Error = 4
TA	log.level.change.ta="4"	TA logging. Default is Minor Error = 4
TLS	log.level.change.tls="4"	TLS [Transport Layer Security] logging. Default is Minor Error = 4
USB	log.level.change.usb="4"	USB logging. Default is Minor Error = 4
USB Dock	log.level.change.dock="4"	USB Dock logging. Default is Minor Error = 4
USB I/O	log.level.change.usbio="4"	USB I/O logging. Default is Minor Error = 4
Util Task	log.level.change.task="4"	Util Task logging. Default is Minor Error = 4
Util-Main	log.level.change.utilm="4"	Util-Main logging. Default is Minor Error = 4
Util-Trace	log.level.change.trace="4"	Util-Trace logging. Default is Minor Error = 4
Video Display	log.level.change.dis="4"	Video Display logging. Default is Minor Error = 4
Video Frame	log.level.change.cap="4"	Video Frame logging. Default is Minor Error = 4
Wapp Mgr	log.level.change.wmgr="4"	Wapp logging. Default is Minor Error = 4
Watch-dog	log.level.change.wdog="4"	Watch-dog logging. Default is Minor Error = 4
WiFi Manager	log.level.change.wifi="1"	WiFi Manager logging. Default is Event 1 = 1
WLAN	log.level.change.wlan="1"	WLAN logging. Includes: AStat, AThresh, NStat, NThresh, Successful Handoff, Failed Handoff, AP RSSI, Retry rates, Missed & Dropped rates, etc.

		Default is Event 1 = 1
XMPP	log.level.change.xmpp="4"	XMPP [Extensible Messaging and Presence Protocol] logging. Default is Minor Error = 4
<b>Settings &gt; Logging &gt; Syslog</b>		Web Browser Location
Server Address	device.syslog.serverName	The syslog server IP address or host name if DNS is used
Server Type	device.syslog.transport	The protocol used by the phone to write to the syslog server. If set to None, transmission is turned off but the IP address is maintained. Default is UDP.
Facility	device.syslog.facility	This provides a description of what generated the log message. Default is 16, which maps to local 0.
Render Level	device.syslog.renderLevel	This specifies the lowest class of event that will be sent (rendered) to the syslog server. It is based on log.render.level and can be a lower value. Default is Minor Error.
Prepend MAC	device.syslog.prependMac	This determines if the phone MAC address is prepended to the log message sent to the syslog server. Default is Enabled.

Log.level.change web based option names include, with corresponding configuration file parameter numbers:

- Debug = 0
- Event 1 = 1
- Event 2 = 2
- Event 3 = 3
- Minor Error = 4
- Major Error = 5
- Fatal Error = 6

## The Way Logging Works

With default level parameters set on a working 8400 wireless telephone, log file (mac-app.log and mac-boot.log) generation occurs as follows:

- log.render.level="1"
- log.render.type="2" [MDHms]
- log.render.stdout="0"
- log.render.file="1"

- log.render.file.size="32"
- log.render.file.upload.period="86400"
- log.render.file.upload.append="1"
- log.render.file.upload.append.sizeLimit="512"
- Log.render.file.upload.append.limitMode="delete"

Logging will occur into internal buffers until the internal buffers are at or near the 32KB mark (to trigger a default size related update) or 86,400 seconds have elapsed (to trigger a default time related update), then the appropriate mac-boot.log or mac-app.log data is written to the provisioning server. These files increment in approximate 32KB chunks (file size of 32KB then 64KB then 96KB, etc.) until the file on the provisioning server reaches or gets near 512KB. Then the file is deleted and the next log file update writes a new file starting with 32KB of log data.

No syslog data is logged, since with default levels and no additional parameters set, the phone does not know the IP address of a syslog server. Therefore, it cannot write syslog data to a syslog server.

Syslog data can contain the same data as log file data with a few new fields pre-pended to the log entry. The following log data (1<sup>st</sup> bullet item) would show up in a syslog file as (2<sup>nd</sup> bullet item):

- 003646.061|app1 |\*|00|[AppUiMisc]:Battery strength is VERY LOW.
- Oct 12 10:42:41 192.168.2.104 Jan 1 00:37:08 192.168.2.104 00907a0cd719|003646.061|app1 |\*|00|[AppUiMisc]:Battery strength is VERY LOW.
  - The fields prepended include: syslog server time stamp, IP address of the 8400 phone, time stamp from the 8400, IP address of 8400, MAC address of 8400 phone

## Disk Space Requirements

Disk space requirements can be predicted, on the provisioning server, with the 8400 phone. As an example with the above settings, 200 wireless telephones would write mac-app.log and mac-boot.log files to their provisioning server. Each file could be up to 512KB. This means each phone could have log files which would use 1MB of disk space. So, 200 phones would use 200MB of space for log files.

Configuration files would add to the disk space requirement for the 8400 wireless telephones. Each phone model code file, sip.Id file, is about 50MB. If all three models of sip.Id files remain on the provisioning server, these files consume about 150MB of disk space. Then configuration template files will use a little more space. This brings the total space requirements to about 350MB – 400MB.

If syslog data is collected and sent to the same system, additional space would be required. Or another system could be used to collect syslog data which would avoid any extra space requirements on the central provisioning server.

Syslog data will contain the same or similar data as log files. One advantage of syslog data is the size of the syslog file is not constrained by the above parameters. So, historical data can be collected for a long period of time. And the syslog file does not get deleted at intervals to start over again, as log files will with the above parameters.

Syslog data sent by the 8400 handset is subject to network congestion or other issues which may prevent log data from arriving at the syslog server as expected. Syslog data is sent with Best Effort QoS, so, a busy network or busy WLAN may cause loss of log data at the syslog server file.

It is recommended to define and use a “Log\_Files” directory, or another name of your choice, in the provisioning server. This allows log files to be stored and found in a separate directory from configuration files and other files on the provisioning server.

Once the ‘Log\_Files’ directory is created off the provisioning server root directory, then the 8400 phones can be told to use this sub-directory in the master configuration file (000000000000.cfg or mac.cfg). The master configuration file will contain a command line similar to the following:

```
<APPLICATION APP_FILE_PATH="sip.Id" CONFIG_FILES="" MISC_FILES="" LOG_FILE_DIRECTORY=""  
OVERIDES_DIRECTORY="" CONTACTS_DIRECTORY="" LICENSE_DIRECTORY=""></APPLICATION>
```

The individual command: LOG\_FILE\_DIRECTORY=”\Log\_Files” will specify the sub-directory to store the log files into. Depending on the syslog server, this command will not create the sub-directory. It must be created manually before it can be used.

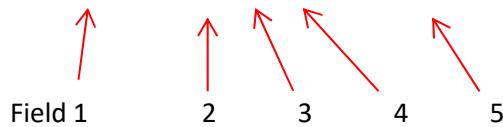

## Logging Module Entry Detail List

This section provides detail on various log level entries.

### Definitions

A typical log file entry contains several fields to be aware of. A sample entry is:

001041.509|app1|\*|00|Manual Restart

Each field is separated by a pipe “|” symbol.

Field definitions are:

- Field 1
  - Time stamp showing up time of the phone when this log entry occurred
  - 001041.509 is up time of: 1,041 seconds. The lowest time in a –boot file is: 000010.519
  - After the phone learns actual local time (from an NTP server) it can display absolute, local time zone or other time formats as in 0103113120 (Jan. 03, 11:31.20).
- Field 2
  - Log Module name
  - There are 80 or so module names (see list below)
- Field 3

- Log entry level:
  - \* = Direct entry = log entry which occurs irrespective of the log level set
  - 0 = Debug logging level
  - 1 = Event 1 logging level
  - 2 = Event 2 logging level
  - 3 = Event 3 logging level
  - 4 = Minor Error only logging level
  - 5 = Major Error only logging level
  - 6 = Fatal Error only logging level
- Field 4
  - The number of missing log messages
- Field 5
  - The log entry detailed information

Certain log entries are summarized in this document. For example, the summary entry of [Battery] Status Summary info will represent “Battery” related entries such as:

- 000110.066|app1 |\*|00|#### Battery authentication success
- 000110.067|app1 |\*|00|[AppUiMisc]:Battery is VERY LOW
- 000024.251|app1 |\*|00|[AppUiMisc]:Battery is very low, SHUTDOWN
- 000024.251|app1 |\*|00|[AppUiMisc]:handleVeryLowBatteryNotifyAlert: Low Battery Shutdown Notification Started
- 000034.395|app1 |\*|00|[AppUiMisc]:handleVeryLowBatteryNotifyAlert: Low Battery Shutdown Notification Ended

  - This entry is from a syslog file. Notice time stamp, phone IP and MAC address prepended to a typical log file entry

In the following list, log levels set at a certain level [number] will collect log entries at that or higher level numbers. For example: with a log level of 4 [default], for a particular module [log.level.change.wlan="4"], log entries at 4, 5 or 6 will be collected in internal buffers and sent to the provisioning server. Lower level log entries will not be collected such as 3, 2, 1 or 0. Set the log level to the lowest level (most verbose level) desired.

## Web Access UI Menu

Use the IP address of the 8400 handset with Google Chroem to connect to the Web UI.

The screenshot shows a web browser window titled "Spectralink 8450 Configur". The address bar displays "10.0.0.229/index.htm". The main content area is titled "Spectralink 8450". A navigation menu at the top includes "Home", "Simple Setup", "Preferences", "Settings", "Diagnostics", and "Utilities". Below the menu, a breadcrumb trail says "You are here: Home". On the left, there's a "VIEWS" sidebar with "Home" selected and "Simple Setup" as an option. The main content area is titled "Home" and displays "Phone Information" with the following details:

Phone Model	Spectralink 8450
Part Number	3111-36152-001 Rev:A
MAC Address	00:90:7A:0D:7B:6E
IP Address	10.0.0.229
UC Software Version	4.8.0.2012
BootROM Software Version	4.8.0.2012

The Home screen of the 8400 phone web interface shows:

- Phone Model
- Part Number and Revision
- MAC Address
- IP Address
- UC Software Version
- BootROM Software Version

## Web Syslog Menu

Click Settings > Syslog to access the syslog menu.

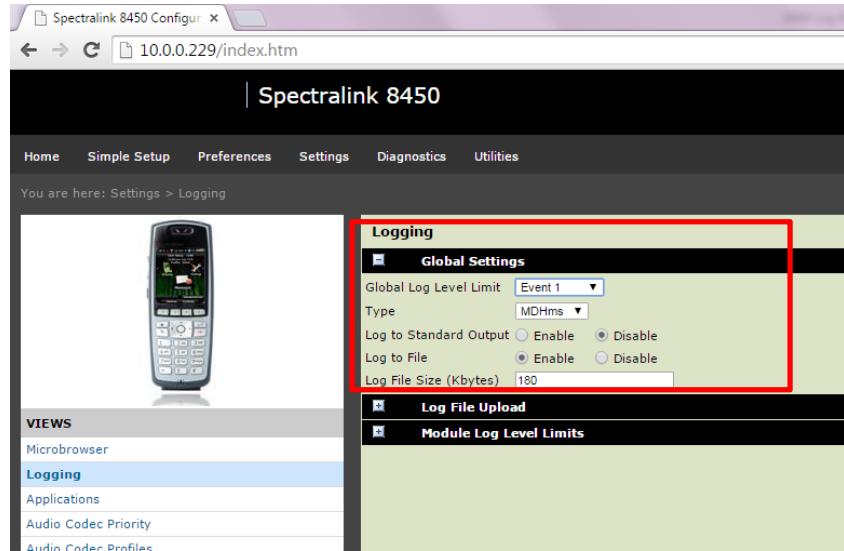

The screenshot shows the Spectralink 8450 Configuration web interface. At the top, there is a header bar with tabs: Home, Simple Setup, Preferences, Settings, Diagnostics, and Utilities. Below the header, a breadcrumb navigation bar indicates the current location: You are here: Settings > Syslog. The main content area is titled "Syslog". On the left side, there is a sidebar with a "VIEWS" section containing links to various configuration pages: Microbrowser, Logging, Applications, Audio Codec Priority, Audio Codec Profiles, Provisioning Server, Syslog (which is currently selected and highlighted in blue), Paging/PTT Configuration, SIP, Lines, Change Password, and Phone Lock. The main right-hand panel displays the "Syslog" configuration settings. These include: Server Address (set to 10.0.0.60), Server Type (set to UDP), Facility (set to 16), Render Level (set to Event 1), and Prepend MAC (with options Enable and Disable). A small image of a mobile phone is visible at the top left of the main panel.

The Syslog Menu screen shows:

- Syslog Server IP address
- Server Type Protocol used
  - UDP is the typical protocol to use for syslog
- Facility
  - The default value of 16 (maps to local 0) provides a description of what generated the syslog message
- Render Level
  - Specifies the lowest level entries which will be logged
  - The individual module level set cannot log entries lower than this master render level
- Prepend MAC
  - Enable allows the phone to prepend the phone MAC address to the syslog entry

## Web Settings → Logging → Global Settings

Click Settings > Logging to access the Global Settings

The current Global Settings include:

- Global Log Level Limit: Event 1 (equals log.render.level="1")
  - No individual module log level will be logged lower than this master level
- Type: MDHms
- Log to Standard Output: Disable
  - The 8400 phone does not have a console cable or port
- Log to File: Enable
  - Enable allows the phone to log entries to the provisioning server
- Log File Size (Kbytes): 180
  - When internal log entries reach 32KB the log will be written to the provisioning server

The Global Log Level Limit determines the lowest (most verbose) level which will be logged from any of the sub-system identified in the Module Log Level Limits. The logging level set here determines the lowest severity log level that can be logged for any sub-system component. Event 1 is more verbose than Event 4.

The Type field specifies how the time stamp is formatted in log file entries. MDHms is Month Day Hour milliseconds. Other choices include: YMDHm and HMSms where Y=Year, M=Month, D=Day, H=Hours, M/m=Minutes, S=Seconds, ms=milliseconds. Typically, when the 8400 boots log files show uptime (000014.236 = 14.236 seconds) until the phone is able to identify Year, Month, Day, Hour, Seconds and milliseconds. Then these time stamps are included in the log file.

Log to Standard Output does not apply to the 8400 phone because (without special modifications) the 8400 does not have a console cable or connection.

Log to File = Enable will allow the phone to write to its internal flash file system. Once the file system is full the contents are written to the provisioning server. Disabling this will disable all logging to the internal flash file system and to the provisioning server.

Log File Size (Kbytes) specifies the size of Internal Flash File system (memory) reserved for log data. When this area gets full the data is output to the provisioning server.

## Web Settings → Logging → Log File Upload

The screenshot shows the Spectralink 8450 Configuration web interface. The URL is 10.0.0.229/index.htm. The main menu includes Home, Simple Setup, Preferences, Settings, Diagnostics, and Utilities. Under Settings, the Logging view is selected. The Logging configuration page has two main sections: Global Settings and Log File Upload. The Log File Upload section is highlighted with a red box. It contains the following settings:

- Upload Period (s): 86400
- Append When Uploading: Enabled
- Upload Append Size Limit (Kbytes): 512
- Upload Append Limit Mode: Delete

Current settings are:

- Upload Period (s) is default at 86,400 seconds (which is 24 hours)
- Append When Uploading set to Enable
- Upload Append Size Limit (Kbytes) set to 512 (default)
  - Set to a larger number to collect more log data with a larger file size
- Upload Append Limit Mode set to Delete

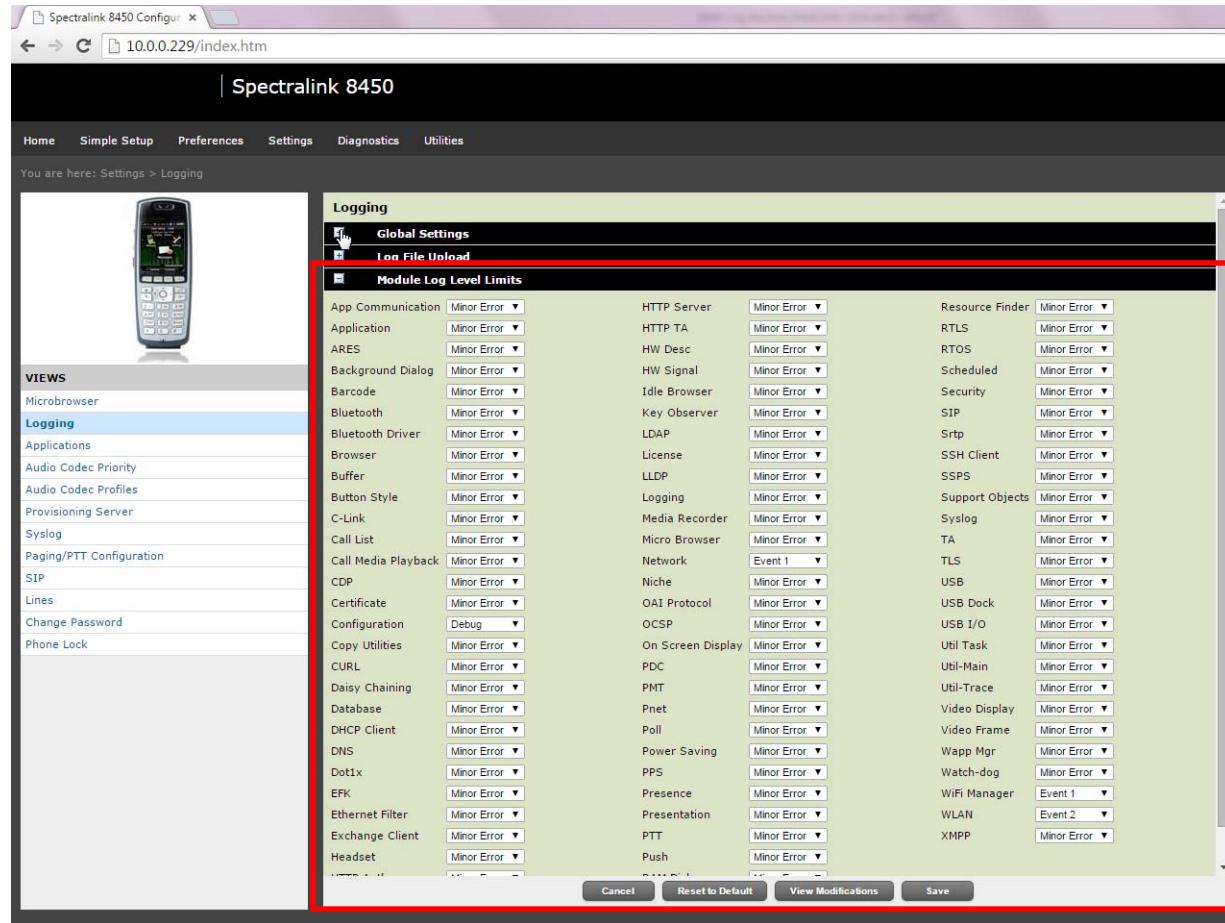

This means the log file on the provisioning server will grow to 512 Kbytes (each update will append to the existing file), then the file is deleted and starts over. Each update to the phone adds 32 Kbytes to the file.

The log data is written to the provisioning server every 24 hours (based on Upload Period parameter).

When troubleshooting, it can be useful to set the Settings > Logging > Log File Upload > Upload Period to 3600 (one hour) or 1800 (30 minutes) or 30 (30 seconds) in order to collect log data more quickly. Set any module log to desired levels (usually Event 1 or 1). Delete the existing mac-app.log and mac-boot.log files (mac-now-app.log and mac-now-boot.log also). Then perform the operation which causes failures. Ensure the log files have been updated (file time stamp) after the operation which fails. Then get copies of the log files to analyze.

If the log files have not been updated when the testing is over, then use the three buttons (1, 5 and 9 simultaneously and beep) to force log files to be written as mac-now-boot.log and mac-now-app.log. After the key press, wait about two minutes for all log data to be written to the log files and be available for collection.

## Web Settings → Logging → Module Log Level Limits

The screenshot shows the Spectralink 8450 Configuration web interface. The top navigation bar includes Home, Simple Setup, Preferences, Settings, Diagnostics, and Utilities. Below this, a breadcrumb trail indicates the current location: You are here: Settings > Logging. On the left, a sidebar titled 'VIEWS' lists various configuration categories like Microbrowser, Applications, and Lines. The main content area is titled 'Logging' and contains three tabs: Global Settings, Log File Upload, and Module Log Level Limits. The 'Module Log Level Limits' tab is active and displays a table of log entries. Each entry consists of a module name and a dropdown menu for selecting the log level. A red box highlights the entire table area. At the bottom of the table are four buttons: Cancel, Reset to Default, View Modifications, and Save.

**Buttons:** Cancel, Reset to Default, View Modifications, Save

Set or check each individual module log level. The default for most modules is Minor Error, which is 4 in the configuration file with these log.level.change.name entries.

## 802.11a/b/g Channel 2.4GHz & 5GHz Frequency Table

802.11bg DSSS Channel 2.4GHz Frequency Range			802.11a OFDM Channel 5GHz Frequency Range		
Channel ID	Channel (Center) Frequencies GHz	Channel Frequency Range	Frequency Band 802.11a Sub-band	Channel	GHz
1	2.412	2.401 - 2.423	UNII 1 5.15-5.25GHz	34	5.170
2	2.417	2.406 - 2.428		36	5.180
3	2.422	2.411 - 2.433		40	5.200
4	2.427	2.416 - 2.438		44	5.220
5	2.432	2.421 - 2.443		48	5.240
6	2.437	2.426 - 2.448		52	5.260
7	2.442	2.431 - 2.453		56	5.280
8	2.447	2.436 - 2.458		60	5.300
9	2.452	2.441 - 2.463		64	5.320
10	2.457	2.446 - 2.468	UNII 2 Extended (DFS) 5.47-5.725GHz	100	5.500
11	2.462	2.451 - 2.473		104	5.520
12	2.467	2.456 - 2.478		108	5.540
13	2.472	2.461 - 2.483		112	5.560
14	2.484	2.473 - 2.495		116	5.580
				120	5.600
				124	5.620
				128	5.640
				132	5.660
				136	5.680
			UNII3 5.725-5.825GHz	140	5.700
				149	5.745
				153	5.765
				157	5.785
			ISM Band	161	5.805
				165	5.825

The left table, above, identifies the frequencies used by each channel in the 802.11b/g (2.4GHz) range.

The spectral bandwidth (channel) is 22MHz wide when 802.11b DSSS is used.

The spectral mask (channel) is 20MHz for 802.11a/g OFDM signaling.

802.11b/g channels 1 through 11 are used in the United States.

In the 5GHz range channels 36 through 165 is used in the United States.

DFS is Dynamic Frequency Selection and is used to avoid weather-radar & military radar. These channels (52 – 140) can take the wireless telephone longer to scan to discover any access points in the area. If possible, avoid using these DFS channels. DFS Channel Announcement must be enabled on the WLAN.

SpectraLink 8020/8030 wireless handsets do not use channel 165. This channel should be disabled on the WLAN when 8020/8030 handsets are used. 8400 & 8700 wireless handsets use channel 165.

## Troubleshooting

Troubleshooting the 8400 wireless telephone involves problem identification, user feedback, data collection and analysis. Then a change in the area revealed through analysis as most likely to improve the outcome and test again.

When troubleshooting, it can be useful to set the Settings > Logging > Log File Upload > Upload Period to 3600 (one hour) or 1800 (30 minutes) in order to collect log data more quickly. Set any module log to desired levels (usually Event 1 or 1). Delete the existing mac-app.log and mac-boot.log files (mac-now-app.log and mac-now-boot.log also) or simply ensure the log files have been updated. Then perform the operation which causes failures. Ensure the log files have been updated (file time stamp) after the operation which fails. Then get copies of the log files to analyze or send to support for analysis.

If the log files have not been updated when the testing is over, then use the three buttons (1,5 and 9 simultaneously) to force log files (mac-now-app.log and mac-now-boot.log) to be written.

It can be useful to calculate the length of time it takes the phone to increment to reach the maximum size of the log file on the provisioning server. With no calls and no registration to a SIP server a test phone sent logging updates, with all modules set to Event 1, every minute with a 15KB increment in file size. Ensure the maximum file size is not reached and deleted before the test sequence can be run. This will help ensure the best data can be generated and collected. This will ensure good data is collected to analyze or sent in for analysis.

## Recommended Logging for Log and Syslog Data Collection

Recommended logging includes getting configured and setup to collect log data and syslog data as needed. Keep log levels for all modules at Minor Error [4], or 6 if less logging is desired, so minimal data is collected. If/when there are issues with the handsets, either specific handsets can be configured for more verbose log levels or all handsets can be configured for more detailed data collection. When investigating an issue investigation it is generally necessary to collect syslog data as well as log data from, at least, a small collection of [test] handsets exhibiting the problem.

- log.render.level="1"
- log.render.type="2"
- log.render.stdout="0"
- log.render.file="1"
- log.render.file.size="32"
- log.render.file.upload.period="86400"
- log.render.file.upload.append="1"
- log.render.file.upload.append.sizeLimit="512"
- Log.render.file.upload.append.limitMode="delete"
- device.syslog.serverName="102.168.2.110"      <- Update with correct syslog IP address
- device.syslog.transport="1"
- device.syslog.facility="16"

- device.syslog.renderLevel="1"
- device.syslog.prependMac="1"

Each log.level.change module parameter should be set to 4 until there is a need to collect more detailed log information.

Then specific modules on specific phones can be set to 1 to collect more detail when a problem occurs. This allows detailed log and syslog data to be collected for analysis to identify, understand, isolate and resolve the issues. The following are sample log level to add when troubleshooting:

- log.level.change.cfg="1"
- log.level.change.net="1"
- log.level.change.sip="1"
- log.level.change.wifi="1"
- log.level.change.wlan="1"

It is a good idea to set no more than 5 modules to level 1. Some modules at level one are very verbose logging much detail. It is possible to overload the internal buffer systems, steal cycles away from important functions for normal telephone and roaming operations or cause WLAN busy conditions.

Of course, the actual module set to level 1 will be determined by the specific failures or symptoms of the wireless telephone and a scan thru the various Logging Module Topics Detail descriptions above.

## **Engineering Suggested Log Levels for 8400 APP Logs Data Collection**

This section describes setting log parameter levels for various issues and problems.

From: <http://newwiki/bin/view/Main/SuggestedLogLevelForDebug>

NOTE: FTP is the only provisioning protocol which allows log files to be appended to and large files collected. TFTP, HTTP & HTTPS will over-write the mac-app.log and mac-boot.log files so they stay small and have little log data.

NOTE: The suggested log levels below assume that all other log levels are set to default values (4).

### **Start with these values for all problem investigations:**

These will get logs big enough and dumped often enough to do some good:

- log.render.level="0"
- log.render.stdout="0"
- log.render.file.size="180"
- log.render.file.upload.period="30"
- log.render.file.upload.append.sizeLimit="65535"
- log.level.change.wlan="2"

### Then add these for the indicated problem type:

Minimize the number of log modules set to 0 (debug) as significant amounts of data will be sent to the server. Do not combine all suggestions below with many log modules set to debug (0).

### SIP Packet or Call Setup/Tear Down Issues

SIP packet flow issues (phone is deregistered, call doesn't go thru, call is dropped, etc)

- log.level.change.sip="0"
- log.level.change.app1="1"

*NOTE: If the customer has to use syslogging because they don't have a provisioning server and they are using Microsoft Lync, using SIP log level 0 may overwhelm the network with packets and many packets may be lost. The only way we have today to get around this is to produce a debug load that limits the number of lines of a SIP packet that is logged. Starting with version 4.7, there will be a new config item that can be used to change the number of lines logged. More on this later...*

### Message Push or Browser Issues

Problems with messages pushed to the phone or any browser issues:

- log.level.change.app1="1"
- log.level.change.httpd="0"
- log.level.change.push="0"
- log.level.change.brow="0"
- log.level.change.wmgr="0"

### Configuration problems:

- log.level.change.cfg="1"
- log.level.change.copy="1"

### One-way audio problems:

- log.level.change.sip="0"
- log.level.change.so="1"

NOTE: This will get the sip packet flow but a simultaneous wireless trace will also be needed.

### Lync dial plan problems

(in 4.11.0 and later). The first two (pps and utilm) will show the dial plan processing and the second two (so and sip) will show access to the dial plan while making a call and will show the sip packet produced.

- log.level.change.pps="2"
- log.level.change.utilm="3"
- log.level.change.so="1"
- log.level.change.sip="0"

### Problems with sounds playing on the phone

- log.level.change.so="1"

### Lync (Skype for Business) certificate issues

- log.level.change.ticket="0"
- log.level.change.tls="0"

### Wireless connection issues (WPA2, et cetera)

- log.level.change.dot1x="0"

## Important Log Data to Locate

There are certain log data details which are or can be important to locate.

The following provides information on many elements and detailed data to locate:

### Model, Serial Number & SW Version

- Jun 26 07:53:06 10.10.128.254 Jan 01 06:08:26 10.10.128.254 SyslogNewtorkStateInfo[3516]: 00907a123922|1420156825370|SyslogNewtorkStateInfo|6|00| Logging to syslog - 8741 serial #641194274 (version:KOT49H 1.5.0.10702 u-boot:2009.08-00779-g72ca4d6)
  - The above shows Spectralink Model 8741, Serial # 641194274, SW Version 1.5.0.10702
  - Also this identifies the 8741 MAC address: 00907a123922 and IP: 10.10.128.254

### SSID, AP MAC and Channel Frequency used by the Handset

- Jun 26 07:53:08 10.10.128.254 Jan 01 06:08:27 10.10.128.254 wpa\_supplicant[2728]: 00907a123922|1420156866710|wpa\_supplicant|6|00| CTRL-EVENT-STATE-CHANGE id=0 state=6 BSSID=00:00:00:00:00:00 SSID=SpectraVoice
  - This identifies the SSID as SpectraVoice
- Jun 26 07:54:51 10.10.128.254 Jan 01 06:10:03 10.10.128.254 wpa\_supplicant[2728]: 00907a123922|1420157401820|wpa\_supplicant|6|00| Trying to associate with 3c:ce:73:c6:21:8e (SSID='SpectraVoice' freq=5180 MHz)
  - This entry identifies SSID SpectraVoice, Trying to associate, AP MAC 3c:ce:73:c6:21:8e and AP Channel frequency 5180 Mhz
  - 5180 MHz is 802.11a channel 36. Refer to 802.11a/b/g Channel Chart, above
- Jun 26 07:54:51 10.10.128.254 Jan 01 06:10:07 10.10.128.254 wpa\_supplicant[2728]: 00907a123922|1420157406920|wpa\_supplicant|6|00| CTRL-EVENT-STATE-CHANGE id=0 state=6 BSSID=3c:ce:73:c6:21:8e SSID=SpectraVoice
  - This identifies SSID SpectraVoice and AP MAC 3c:ce:73:c6:21:8e

## WLAN AP Channel List

- Jun 26 07:54:51 10.10.128.254 Jan 01 06:10:07 10.10.128.254 wpa\_supplicant[2728]:  
00907a123922|1420157407020|wpa\_supplicant|6|00| Successful Handoff to  
3cce.73c6.218e(Channel:36 Score:428 RSSI:-72 dBm Penalty:0) from  
3cce.736d.c8ae(Channel:161 Score:455 RSSI:-45 dBm Penalty:0), Reason 151, Other Aps:  
3cce.7371.d48e (Channel:36 Score:416 RSSI:-84 dBm Penalty:0 Reason:140), TxPO:15 dBm,  
TxPN:15 dBm
  - This identifies:
  - The handset roamed to AP MAC 3cce.73c6.218e on Channel:36 with AP RSSI:-72 dBm
  - The handset roamed from AP MAC 3cce.736d.c8ae on Channel:161 with AP RSSI:-45 dBm because of Reason 151 (Lost AP - Missed Beacons from AP)
  - The TxPO:15 dBm (Old AP TX Power is 15 dBm [~31mw], the handset TX Power will match)
  - The TXPN:15dBm (New AP TX Power is 15dBm, the handset will match)

## Calls Have been Placed to

## Module Detail Data by Log Level

The following bulleted list provides detail on each logging module name and log level:

### App Communication (log.level.change.acom)

- Direct [\*] level entries:
- log.level.change.acom="1"
- log.level.change.acom="2"
- log.level.change.acom="3"
  - 000019.970|acom |3|00|New spipgui application connection is detected from 127.0.0.1:37074.
  - 0103151806|acom |3|00|New dbs application connection is detected from 127.0.0.1:38610.
  - 0103151807|acom |3|00|New osd application connection is detected from 127.0.0.1:39378.
  - 0103151807|acom |3|00|New browser application connection is detected from 127.0.0.1:39890.
  -
- log.level.change.acom="4"
  - 0410135221|acom |4|00|App "ec" has failed to read a message, error number = 92
  - 0410135221|acom |4|00|Application ec from 127.0.0.1 [406] has been disconnected.
- log.level.change.acom="5"
  - 0410135221|acom |5|00|AppComServer encountered a connection error.
- Log.level.change.acom="6"

### Application [log.level.change.app1]

- Direct [\*] Level entries:
  - 000010.522|app1 |\*|01|Initial log entry. Current logging level 3
  -
